A pair of Chinese Kingfisher Feather Hairpins

Description:

“Tian-tsui (traditional: 點翠, simplified: 点翠, pinyin: diǎncuì, "dotting with kingfishers") is a style of Chinese art featuring kingfisher feathers. For 2,000 years, the Chinese have been using the iridescent blue feathers of kingfisher birds as an inlay for fine art objects and adornment, from hairpins, headdresses, and fans to panels and screens. While Western art collectors have focused on other areas of Chinese art including porcelain, lacquer ware, sculpture, cloisonné, silk and paintings, kingfisher art is relatively unknown outside of China. Kingfisher feathers are painstakingly cut and glued onto gilt silver. The effect is like cloisonné, but no enamel was able to rival the electric blue color. Blue is the traditional favorite color in China. As with most iridescent, electrifying colors in animals such as morpho butterfly wings, the intense color in bird feathers comes not from pigments in the feather itself, but from the way light is bent and reflected back out, much like a prism breaks white light into its spectrum of rainbow colors. These microscopic structures in feathers are called photonic crystals. The most expensive, commissioned pieces used a species of kingfisher from Cambodia. So great was the export to sate Chinese demand, the trade of feathers may have been a major contributor to the wealth of the Khmer Empire, and used to help fund the construction of the magnificent temples near Siem Reap, Cambodia including Angkor Wat. The finest pieces of kingfisher art were reserved for royalty or high-ranking Chinese government official (called a "mandarin (bureaucrat)"). The usage of kingfisher feathers resulted in the mass slaughter of many
Kingfisher art as a high art form came to an end during the Chinese Revolution in the 1940s. (source Wikipedia)

- Origin: China
- Culture, Dynasty, Period: Late Qing dynasty
- Date:
  - Early 20th Century
- Height (cm): 14
- Material: Silver, kingfisher feather, glass beads
